THE TRUTH ABOUT INHALANTS

SLANG - ARNOLDS, GYM CANDY, PUMPER, STACKERS, WEIGHT TRAINERS, JUICE

Get the facts...

Inhalants affect your brain. Inhalants are substances or fumes from products such as glue or paint thinner that are sniffed or "huffed" to cause an immediate high. Because they affect your brain with much greater speed and force than many other substances, they can cause irreversible physical and mental damage before you know what's happened.

Inhalants affect your heart. Inhalants starve the body of oxygen and force the heart to beat irregularly and more rapidly—that can be dangerous for your body.

Inhalants damage other parts of your body. People who use inhalants can experience nausea and nosebleeds; develop liver, lung, and kidney problems; and lose their sense of hearing or smell. Chronic use can lead to muscle wasting and reduced muscle tone and strength.

Inhalants can cause sudden death. Inhalants can kill you instantly. Inhalant users can die by suffocation, choking on their vomit, or having a heart attack.

Before You Risk it...

Get the facts. Inhalants can kill you the very first time you use them.

Stay informed. Guam Public Law 28-25: Regulates the sale of Butane, Propane and other inhalants to minors. It is a misdemeanor for any business to sell or transfer butane lighters or butane in any form and propane gas to any person under the age of eighteen (18). Inhalants include a large group of chemicals that are found in such household products as aerosol sprays, cleaning fluids, glue, paint, paint thinner, gasoline, propane, nail polish remover, correction fluid, and marker pens. None of these items are safe to inhale—they all can kill you.

Be aware. Chemicals like amyl nitrite and isobutyl nitrite ("poppers") and nitrous oxide ("whippets") are often sold at concerts and dance clubs. They can permanently damage your body and brain.

Know the risks. Chronic inhalant abusers may permanently lose the ability to perform everyday functions like walking, talking, and thinking.

Guam Department of Youth Affairs (DYA) reports: Inhalants are one of the most common drugs of abuse among court

involved youth. In 2005, 25% (or one in four) of DYA's youth reported experimenting with inhalants.

Look around you. Rates of lifetime and current inhalant use among Guam youth surpassed the national rates in 2001 and 2003. Current inhalant use among high school students is 6.3% higher for Guam vs. 3.0% nationwide.

Know the Signs...

How can you tell if a friend is using inhalants?

Sometimes it's tough to tell. But there are signs you can look for. If your friend has one or more of the following warning signs, he or she may be using inhalants:

- Slurred speech
- Drunk, dizzy, or dazed appearance
- Unusual breath odor
- Chemical smell on clothing
- Paint stains on body or face
- Red eyes
- Runny nose

What can you do to help someone who is using inhalants? Be a real friend. Encourage your friend to seek professional help.

Q. Since inhalants are found in household products, aren't they safe?

A. No. Even though household products like glue and air freshener have legal, useful

purposes, when they are used as inhalants they are harmful and dangerous. These products are not intended to be inhaled.

Q. Doesn't it take many "huffs" before you're in danger?

A. No. One "huff" can kill you. Or the 10th. Or the 100th. Every huff can be dangerous. Even if you have huffed before without experiencing a problem, there's no way of knowing how the next huff will affect you.

Q. Can inhalants make me lose control?

A. Yes. Inhalants affect your brain and can cause you to suddenly engage in violent, or even deadly, behavior. You could hurt yourself or the people you love.

QUESTION AND ANSWER

Check out the Web site at <http://www.freevibe.com> or visit the Office of National Drug Control Policy Web site at <http://www.whitehouseondrugpolicy.gov>
